ORGANIC ACIDS

Animal feed should be in excellent condition to ensure its hygiene and nutritional value. Animal feedstuff should be kept free from harmful bacteria during their storage and to ensure safe feed until it is consumed by the animal.

Propionic acid in its salt form is a feed preservative, protects the raw materials for animal nutrition and compound feeds from the proliferation of moulds, yeasts and bacteria, prevents the mycotoxin production, inhibits the fermentation and consequently caking and the loss of nutritive substances with positive effects on animal productivity.

The presence of Salmonella, their economic and health risk needs thorough hygiene management throughout the entire chain from feeding to meat processing. Certain organic acids especially Formic acid in well proportioned and reacted combinations are widely recognised to have synergistic action as antimicrobial.

This blend of organic acids works in synergy to prevent mould and bacteria development in feed and raw materials.

Composition :

Calcium formate
Calcium Propionate
Calcium lactate
Sorbic acid

Directions for Usage:

Inclusion Rate: 1-2kg/ton of feed

Packing: 25 kg bag

Organic Acids
